## 20. Abstract.

A statistical procedure is asymptotically robust if its large-sample properties hold under conditions more general than the conditions under which the procedure is derived. The justification of such properties is often based directly or indirectly on a central limit theorem. In this paper a form of the Lindeberg condition appropriate for martingale differences is used to obtain consistency and asymptotic normality of statistics for regression and autoregression. The regression model is  $y_t = Bz_t + v_t$ . The unobserved error sequence  $\{v_t\}$  is a sequence of martingale differences with conditional covariance matrices  $\{\Sigma_t\}$  and satisfying

$$\frac{1}{n} \sup_{t=1, \dots, n} \mathcal{E} \{v_t' v_t I(v_t' v_t > a) | z_t, v_{t-1}, z_{t-1}, \dots\} \xrightarrow{P} 0$$

as  $a \rightarrow \infty$ . The sample covariance of the independent variables,  $z_1, \dots, z_n$ , is assumed to have a probability limit  $M$ , constant and nonsingular:  $\max_{t=1, \dots, n} z_t' z_t / n \xrightarrow{P} 0$ . If  $(1/n) \sum_{t=1}^n \Sigma_t \xrightarrow{P} \Sigma$ , constant, then  $\sqrt{n} \text{vec}(\hat{B}_n - B) \xrightarrow{\mathcal{L}} N(0, M^{-1} \otimes \Sigma)$ .

The autoregression model is  $x_t = Bx_{t-1} + v_t$  with the above conditions on  $\{v_t\}$  and

$$\frac{1}{n} \sum_{t=\max(r,s)+1}^n (\Sigma_t \otimes v_{t-1-r} v_{t-1-s}') \xrightarrow{P} \delta_{rs} (\Sigma \otimes \Sigma),$$

where  $\delta_{rs}$  is the Kronecker delta. Then  $\sqrt{n} \text{vec}(\hat{B}_n - B) \xrightarrow{\mathcal{L}} N(0, \Gamma^{-1} \otimes \Sigma)$ , where  $\Gamma = \sum_{s=0}^{\infty} B^s \Sigma (B')^s$ .

## 1. Introduction.

A statistical procedure is asymptotically robust if its large-sample properties hold under conditions more general than the conditions under which the procedure is derived. The justification of such procedures is often based directly or indirectly on a central limit theorem. In this paper Lindeberg-type conditions are utilized to establish asymptotic normality of sample regression and autoregression coefficients.

The classic central limit theorem for independent identically distributed scalar random variables  $x_1, x_2, \dots$  states that  $\sqrt{n} \bar{x}_n \xrightarrow{\mathcal{L}} N(0, \sigma^2)$  as  $n \rightarrow \infty$  if  $\mathcal{E}x_i = 0$  and  $\mathcal{E}x_i^2 = \sigma^2$ ; here  $\bar{x}_n = \sum_{i=1}^n x_i/n$  is the mean of the first  $n$  observations. The requirement that the variables be identically distributed can be dropped. For  $\mathcal{E}x_i = 0$  and  $\mathcal{E}x_i^2 = \sigma_i^2$ ,

$$(1.1) \quad \frac{1}{\tau_n} \sum_{i=1}^n x_i \xrightarrow{\mathcal{L}} N(0, 1),$$

where

$$(1.2) \quad \tau_n^2 = \sum_{i=1}^n \sigma_i^2,$$

if for any given  $\varepsilon > 0$

$$(1.3) \quad \frac{1}{\tau_n^2} \sum_{i=1}^n \mathcal{E}x_i^2 I(x_i^2 > \varepsilon \tau_n^2) \rightarrow 0$$

as  $n \rightarrow \infty$ . Here  $I(\cdot)$  is the indicator function. If  $\sigma_n^2/\tau_n^2 \rightarrow 0$  as  $n \rightarrow \infty$ , then (1.1) implies (1.3); in this sense the Lindeberg (1922) condition (1.3) is minimal.

The condition of independence can be weakened to a condition of martingale differences. A very general theorem, which we shall use, has been given by Dvoretzky (1972). For justification of later theorems we state this result in terms of a triangular array of random variables (and include a normalization in the definition of the random variables).

**Theorem** (Dvoretzky). Let  $x_{n1}, \dots, x_{nn}$  be a set of random variables and  $\mathcal{F}_{n0} \subset \mathcal{F}_{n1} \subset \dots \subset \mathcal{F}_{nn}$  be a set of  $\sigma$ -fields,  $n = 1, 2, \dots$ , such that  $x_{nj}$  is  $\mathcal{F}_{nj}$ -measurable.

$$(1.4) \quad \mathcal{E}(x_{nj} | \mathcal{F}_{n,j-1}) = 0 \quad \text{a.s.,}$$

$$(1.5) \quad \mathcal{E}(x_{nj}^2 | \mathcal{F}_{n,j-1}) = \sigma_{nj}^2 \quad \text{a.s.,}$$

$$(1.6) \quad \sum_{i=1}^n \sigma_{ni}^2 \xrightarrow{P} \sigma^2$$

as  $n \rightarrow \infty$ , where  $\sigma^2$  is constant, and for any given  $\varepsilon > 0$

$$(1.7) \quad \sum_{j=1}^n \mathcal{E}[x_{nj}^2 I(x_{nj}^2 > \varepsilon) | \mathcal{F}_{n,j-1}] \xrightarrow{P} 0.$$

Then

$$(1.8) \quad \sum_{j=1}^n x_{nj} \xrightarrow{\mathcal{L}} N(0, \sigma^2).$$

Dvoretzky actually showed that this result holds if  $\mathcal{F}_{n,j-1}$  is replaced by  $\mathcal{B}_{n,j-1}$ , the  $\sigma$ -field generated by  $\sum_{i=1}^{j-1} x_{ni}$ . Generalizations have been given in Section 3.2 of Hall and Heyde (1980) and Section 9.5 of Chow and Teicher (1988). Further references can be found in these books.

In this paper we consider the estimation of the matrix of regression coefficients  $B$  in the model

$$(1.9) \quad y_t = Bz_t + v_t, \quad t = 1, 2, \dots,$$

where the unobservable vector disturbances  $v_t$  are martingale differences; that is, the conditional expected value of  $v_t$  given earlier observed  $y_t$ 's and  $z_t$ 's is  $0$ . The conditional second-order moments of the  $v_t$ 's are finite, but not necessarily the same for all  $t$ . However, the  $v_t$ 's satisfy a kind of Lindeberg condition. The "independent" variables  $z_t$  are assumed to have a sample covariance matrix that converges to a limit in probability, and the  $z_t$ 's satisfy a kind of asymptotic negligibility condition. It is shown that the least squares estimator of  $B$  has an asymptotic distribution that is the same as in the case that the  $v_t$ 's are independent and normal with mean  $0$  and constant covariance matrix. Thus the disturbances do not need to be homoscedastic nor do they need to be independent. The relaxed conditions are particularly important when the observed  $z_t$ 's and  $y_t$ 's constitute a time series.

In the autoregressive model, which is extensively used in time series analysis,

$$(1.10) \quad x_t = Bx_{t-1} + v_t, \quad t = 1, 2, \dots,$$

the vector  $\mathbf{z}_t$  is replaced by  $\mathbf{x}_{t-1}$ . The conditions on the  $\mathbf{v}_t$ 's imply the desired conditions on the  $\mathbf{x}_{t-1}$ 's.

In Section 4 the mixed model is considered; the right-hand side may contain both lagged "dependent" variables and independent variables.

If the disturbances in the regression model are normal, independent, and homoscedastic, and the independent variables are nonstochastic, the estimator of  $\mathbf{B}$  has a normal distribution with expected value  $\mathbf{B}$  and covariances determined by the common covariance matrix of the disturbances; it follows that the asymptotic distribution is normal. The restriction of homoscedasticity was relaxed by Anderson (1971) in Theorems 2.6.1 and 2.6.2 under a Lindeberg-type condition on the disturbances and the condition that the sample covariance matrix of the independent variables have a nonsingular limit.

In the autoregression model the least squares estimator of  $\mathbf{B}$  is nonlinear in the disturbances. Mann and Wald (1943) showed that the asymptotic distribution of the estimator of  $\mathbf{B}$  is normal under the condition that the disturbances are independently identically distributed and possess moments of all orders. Anderson (1959) showed that in this case only the second-order moments need to be finite.

There are many recent results in this area. Lai and Robbins (1981) proved a theorem for a scalar dependent variable with independent identically distributed disturbances. Lai and Wei (1982) proved a similar theorem under the conditions that the moments of the disturbances of some order greater than 2 are bounded and that the variances of the disturbances converge to a constant a.s. Our approach follows these papers, but the conditions have been relaxed. Chan and Wei (1987) have used a Lindeberg condition for a special case of the autoregressive process; see also Lai and Siegmund (1983).

## 2. Robustness in Regression.

We consider the regression model in which the observed vector-valued dependent variable  $\mathbf{y}_t$  is generated by

$$(2.1) \quad \mathbf{y}_t = \mathbf{B}\mathbf{z}_t + \mathbf{v}_t, \quad t = 1, 2, \dots,$$

where  $\mathbf{z}_t$  is an observed vector-valued independent variable and  $\{\mathbf{v}_t\}$  is a sequence of (unobservable) martingale differences satisfying a Lindeberg-type condition.

**Theorem 1.** Let  $\{z_t, v_t\}$ ,  $t = 1, 2, \dots$ , be a sequence of pairs of random vectors, and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_{t-1}$ -measurable and  $v_t$  is  $\mathcal{F}_t$ -measurable. Let the matrix  $D_n$  be  $\mathcal{F}_0$ -measurable such that

$$(2.2) \quad D_n^{-1} \sum_{t=1}^n z_t z'_t (D'_n)^{-1} \xrightarrow{p} C,$$

a constant matrix, as  $n \rightarrow \infty$ , and

$$(2.3) \quad \max_{t=1, \dots, n} z'_t (D_n D'_n)^{-1} z_t \xrightarrow{p} 0.$$

Suppose further that  $\mathcal{E}(v_t | \mathcal{F}_{t-1}) = 0$  a.s.,  $\mathcal{E}(v_t v'_t | \mathcal{F}_{t-1}) = \Sigma_t$  a.s.,

$$(2.4) \quad \sum_{t=1}^n [\Sigma_t \otimes D_n^{-1} z_t z'_t (D'_n)^{-1}] \xrightarrow{p} \Sigma \otimes C,$$

where  $\Sigma$  is a constant positive semidefinite matrix, and

$$(2.5) \quad \sup_{t=1, 2, \dots} \mathcal{E}[v'_t v_t I(v'_t v_t > a) | \mathcal{F}_{t-1}] \xrightarrow{p} 0$$

as  $a \rightarrow \infty$ . Then

$$(2.6) \quad \text{vec} \left( D_n^{-1} \sum_{t=1}^n z_t v'_t \right) \xrightarrow{\mathcal{L}} N(0, \Sigma \otimes C).$$

**Proof.** The conclusion holds if

$$(2.7) \quad \begin{aligned} \text{tr } D_n^{-1} \sum_{t=1}^n z_t v'_t B &= \sum_{t=1}^n v'_t B D_n^{-1} z_t \\ &\xrightarrow{\mathcal{L}} N(0, \text{tr } \Sigma B C B') \end{aligned}$$

for every  $B$ . Let  $u_{nt} = B D_n^{-1} z_t$ ,  $t = 1, \dots, n$ . Then

$$(2.8) \quad \sum_{t=1}^n u_{nt} u'_{nt} \xrightarrow{p} B C B' = D,$$

say. We want to show that

$$(2.9) \quad \sum_{t=1}^n u'_{nt} v_t \xrightarrow{\mathcal{L}} N(0, \text{tr } \Sigma D).$$

Condition (2.3) implies

$$(2.10) \quad \max_{t=1, \dots, n} \mathbf{u}'_{nt} \mathbf{u}_{nt} \xrightarrow{p} 0.$$

Let

$$(2.11) \quad \mathbf{w}_{nt} = \mathbf{u}_{nt} I(\|\mathbf{u}_{nt}\| \leq 1), \quad t = 1, \dots, n, \quad n = 1, 2, \dots$$

Then  $\|\mathbf{w}_{nt}\| \leq 1$  and

$$(2.12) \quad \Pr \{ \mathbf{w}_{nt} = \mathbf{u}_{nt}, \quad t = 1, \dots, n \} \longrightarrow 1$$

as  $n \rightarrow \infty$ .

Now we shall verify that  $x_{nt} = \mathbf{w}'_{nt} \mathbf{v}_t$  satisfy the conditions of Dvoretzky's theorem.

We have

$$(2.13) \quad \mathcal{E}(\mathbf{w}'_{nt} \mathbf{v}_t | \mathcal{F}_{t-1}) = \mathbf{w}'_{nt} \mathcal{E}(\mathbf{v}_t | \mathcal{F}_{t-1}) = \mathbf{0} \quad \text{a.s.,}$$

$$(2.14) \quad \sum_{t=1}^n \mathcal{E}[(\mathbf{w}'_{nt} \mathbf{v}_t)^2 | \mathcal{F}_{t-1}] = \sum_{t=1}^n \mathbf{w}'_{nt} \boldsymbol{\Sigma}_t \mathbf{w}_{nt} \xrightarrow{p} \text{tr } \boldsymbol{\Sigma} D$$

by (2.4). The third condition for  $\{\mathbf{w}_{nt}\}$  to satisfy is

$$(2.15) \quad A_n(\delta) = \sum_{t=1}^n \mathcal{E} \{ (\mathbf{w}'_{nt} \mathbf{v}_{nt})^2 I[(\mathbf{w}'_{nt} \mathbf{v}_{nt})^2 > \delta] | \mathcal{F}_{t-1} \} \xrightarrow{p} 0 \quad \forall \delta > 0;$$

that is, given  $\delta > 0$ ,  $\varepsilon > 0$ , and  $\gamma > 0$ , there exists  $n(\varepsilon, \gamma)$  such that for  $n > n(\varepsilon, \gamma)$

$$(2.16) \quad \Pr \{ A_n(\delta) < \varepsilon \} > 1 - \gamma.$$

We have

$$(2.17) \quad \begin{aligned} A_n(\delta) &= \sum_{t=1}^n \mathbf{w}'_{nt} \mathbf{w}_{nt} \mathcal{E} \left\{ \left( \frac{\mathbf{w}'_{nt}}{\|\mathbf{w}_{nt}\|} \mathbf{v}_t \right)^2 I \left[ \left( \frac{\mathbf{w}'_{nt}}{\|\mathbf{w}_{nt}\|} \mathbf{v}_t \right)^2 > \frac{\delta}{\|\mathbf{w}_{nt}\|^2} \right] \middle| \mathcal{F}_{t-1} \right\} \\ &\leq \sum_{t=1}^n \mathbf{w}'_{nt} \mathbf{w}_{nt} \mathcal{E} \left\{ \mathbf{v}'_t \mathbf{v}_t I \left[ \mathbf{v}'_t \mathbf{v}_t > \frac{\delta}{\|\mathbf{w}_{nt}\|^2} \right] \middle| \mathcal{F}_{t-1} \right\}. \end{aligned}$$

Given  $\varepsilon^* > 0$  and  $\gamma^* > 0$  there exists  $n^*(\varepsilon^*, \gamma^*)$  such that for  $n > n^*(\varepsilon^*, \gamma^*)$

$$(2.18) \quad \Pr \left\{ \|\mathbf{w}_{nt}\|^2 \leq \varepsilon^*, t = 1, \dots, n \right\} > 1 - \gamma^*.$$

Hence

$$(2.19) \quad \Pr \left\{ A_n(\delta) \leq \sum_{t=1}^n \mathbf{w}'_{nt} \mathbf{w}_{nt} \mathcal{E} \left[ \mathbf{v}'_t \mathbf{v}_t I \left( \mathbf{v}'_t \mathbf{v}_t > \frac{\delta}{\varepsilon^*} \right) \middle| \mathcal{F}_{t-1} \right] \right\} \geq 1 - \gamma^*.$$

Since

$$(2.20) \quad \begin{aligned} \sum_{t=1}^n \mathbf{w}'_{nt} \mathbf{w}_{nt} \mathcal{E} \left\{ \mathbf{v}'_t \mathbf{v}_t I \left( \mathbf{v}'_t \mathbf{v}_t > \frac{\delta}{\varepsilon^*} \right) \middle| \mathcal{F}_{t-1} \right\} \\ \leq \sum_{t=1}^n \mathbf{x}'_{nt} \mathbf{x}_{nt} \sup_s \mathcal{E} \left\{ \mathbf{v}'_s \mathbf{v}_s I \left( \mathbf{v}'_s \mathbf{v}_s > \frac{\delta}{\varepsilon^*} \right) \middle| \mathcal{F}_{s-1} \right\} \\ = B_n \left( \frac{\delta}{\varepsilon^*} \right), \end{aligned}$$

say. That is,

$$(2.21) \quad \Pr \left\{ A_n(\delta) \leq B_n \left( \frac{\delta}{\varepsilon^*} \right) \right\} \geq 1 - \gamma^*$$

if  $n > n^*(\varepsilon^*, \gamma^*)$ . Let

$$(2.22) \quad C(d) = \sup_{s=1,2,\dots} \mathcal{E}[\mathbf{v}'_s \mathbf{v}_s I(\mathbf{v}'_s \mathbf{v}_s > d) | \mathcal{F}_{s-1}].$$

Condition (2.5) is that given  $\epsilon > 0$ ,  $\bar{\gamma} > 0$  there exists a  $d(\epsilon, \bar{\gamma})$  such that for  $d > d(\epsilon, \bar{\gamma})$

$$(2.23) \quad \Pr \{ C(d) \leq \epsilon \} \geq 1 - \bar{\gamma}.$$

Condition (2.2) implies that given  $a > 0$ ,  $\bar{\gamma} > 0$  there exists  $\bar{n}(a, \bar{\gamma})$  such that

$$(2.24) \quad \Pr \left\{ \sum_{t=1}^n \mathbf{x}'_{nt} \mathbf{x}_{nt} \leq \text{tr } \mathbf{D} + a \right\} \geq 1 - \bar{\gamma}.$$

Hence

$$(2.25) \quad \Pr \left\{ B_n \left( \frac{\delta}{\epsilon^*} \right) < \epsilon \right\} \leq 1 - \bar{\gamma} - \bar{\gamma}$$

if  $(\text{tr } \mathbf{D} + a)\epsilon \leq \varepsilon$ ,  $\delta/\varepsilon^* \geq d(\epsilon, \gamma)$ , and  $n \geq \bar{n}(a, \bar{\gamma})$ . Then (2.16) holds if  $\gamma^* + \bar{\gamma} + \bar{\gamma} \leq \gamma$ ,  $(\text{tr } \mathbf{D} + a)\epsilon \leq \varepsilon$ ,  $\varepsilon^* \leq \delta/d(\epsilon, \bar{\gamma})$ , and  $n > \max [n^*(\varepsilon^*, \gamma^*), \bar{n}(a, \bar{\gamma})]$ . The theorem follows from the theorem in the introduction [Dvoretzky (1972)]. [See, also, Corollary 3.1 of Hall and Heyde (1980) or Theorem 2, Section 9.5, of Chow and Teicher (1988).] ■

**Theorem 2.** Let  $\{\mathbf{v}_t\}$  be a sequence of random vectors and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $\mathbf{v}_t$  is  $\mathcal{F}_t$ -measurable,  $\mathcal{E}(\mathbf{v}_t | \mathcal{F}_{t-1}) = \mathbf{0}$  a.s.,  $\mathcal{E}(\mathbf{v}_t \mathbf{v}_t' | \mathcal{F}_{t-1}) = \Sigma_t$  a.s.,

$$(2.26) \quad \frac{1}{n} \sum_{t=1}^n \Sigma_t \xrightarrow{p} \Sigma,$$

constant, and

$$(2.27) \quad \frac{1}{n} \sum_{t=1}^n \mathcal{E}[\mathbf{v}_t' \mathbf{v}_t I(\mathbf{v}_t' \mathbf{v}_t > n\varepsilon) | \mathcal{F}_{t-1}] \xrightarrow{p} 0.$$

Then

$$(2.28) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{v}_t \mathbf{v}_t' \xrightarrow{p} \Sigma.$$

**Proof.** If  $\mathbf{v}_t$  is scalar, the proof follows from Theorem 2.23 of Hall and Heyde (1980) as indicated by Chan and Wei (1987). The theorem is then verified by taking arbitrary linear combinations of  $\mathbf{v}_t$ . ■

**Theorem 3.** For  $n$  observations on the model (2.1) define

$$(2.29) \quad \hat{B}_n = \sum_{t=1}^n \mathbf{y}_t \mathbf{z}_t' \left( \sum_{t=1}^n \mathbf{z}_t \mathbf{z}_t' \right)^{-1}.$$

$$(2.30) \quad \begin{aligned} \hat{\Sigma}_n &= \frac{1}{n} \sum_{t=1}^n (\mathbf{y}_t - \hat{B}_n \mathbf{z}_t)(\mathbf{y}_t - \hat{B}_n \mathbf{z}_t)' \\ &= \frac{1}{n} \sum_{t=1}^n \mathbf{v}_t \mathbf{v}_t' - \frac{1}{n} (\hat{B}_n - B) \sum_{t=1}^n \mathbf{z}_t \mathbf{z}_t' (\hat{B}_n - B)'. \end{aligned}$$

If the conditions of Theorem 1 hold with  $C$  nonsingular, then

$$(2.31) \quad \text{vec} [(\hat{B}_n - B)D_n] \xrightarrow{\mathcal{L}} N(0, C^{-1} \otimes \Sigma).$$

If, further, (2.26) holds, then

$$(2.32) \quad \hat{\Sigma}_n \xrightarrow{P} \Sigma.$$

**Proof.** The proof of (2.31) is a straightforward application of Theorem 1. The second term on the right-hand side of (2.30) is

$$(2.33) \quad \frac{1}{n}(\hat{B}_n - B)D_n^{-1} \left[ D_n^{-1} \sum_{t=1}^n z_t z_t' (D_n')^{-1} \right] [(\hat{B}_n - B)D_n^{-1}]' \xrightarrow{P} 0$$

by (2.2) and (2.31). ■

The purpose of condition (2.3) is to assure asymptotic negligibility of  $z_t v_t'$ . What alternative conditions imply (2.3)?

**Lemma 1.** Let  $\{z_t\}$  be a sequence of random vectors, and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_t$ -measurable. Let  $D_n$  be  $\mathcal{F}_0$ -measurable such that  $D_n^{-1} \rightarrow 0$  a.s.,  $D_n D_{n+1}^{-1} \xrightarrow{P} I$  a.s., and

$$(2.34) \quad D_n^{-1} \sum_{t=1}^n z_t z_t' (D_n')^{-1} \rightarrow C \quad \text{a.s.}$$

Then

$$(2.35) \quad \max_{t=1, \dots, n} z_t' (D_n D_n')^{-1} z_t \rightarrow 0 \quad \text{a.s.}$$

**Proof.** From (2.34) we have

$$(2.36) \quad \begin{aligned} & D_{n+1}^{-1} \sum_{t=1}^{n+1} z_t z_t' (D_{n+1}')^{-1} - D_n^{-1} \sum_{t=1}^n z_t z_t' D_n^{-1} \\ &= D_n^{-1} z_{n+1} z_{n+1}' (D_n')^{-1} + D_{n+1}^{-1} \sum_{t=1}^{n+1} z_t z_t' (D_{n+1}')^{-1} \\ &\quad - (D_n^{-1} D_{n+1}) D_{n+1}^{-1} \sum_{t=1}^{n+1} z_t z_t' (D_{n+1}')^{-1} (D_{n+1}^{-1} D_{n+1})' \\ &\rightarrow 0 \quad \text{a.s.} \end{aligned}$$

That is,  $\|D_n^{-1}z_{n+1}\|^2 \rightarrow 0$  a.s. This implies (2.35) by the proof of Lemma 2.6.1 in Anderson (1971). ■

A special case of  $\{z_t\}$  is that of  $z_t$  nonstochastic; then (2.34) (which is the same as (2.2) when  $\{z_t\}$  is nonstochastic) implies (2.35) with the limits nonstochastic. In particular, if  $D_n$  is diagonal and the  $j$ -th diagonal element of  $D_n$  is the square root of the sum of squares of the  $j$ -th elements of the  $z_t$ 's, then  $D_n^{-1} \sum_{t=1}^n z_t z_t' (D_n')^{-1}$  is the correlation matrix of  $z_1, \dots, z_n$ . The theorem in this case is a relaxation of Theorems 2.6.1 and 2.6.2 of Anderson (1971).

**Theorem 4.** Let  $\{z_t\}$  be a sequence of random vectors, and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_t$ -measurable and

$$(2.37) \quad \sum_{t=1}^n \mathcal{E} \{ z_t' (D_n D_n')^{-1} z_t I [z_t' (D_n D_n')^{-1} z_t > \varepsilon] | \mathcal{F}_{t-1} \} \xrightarrow{P} 0.$$

Then (2.3) holds.

**Proof.** We use Lemma 3.5 of Dvoretzky (1972): If  $\{\mathcal{F}_t\}$  is an increasing sequence of  $\sigma$ -fields and  $A_t \in \mathcal{F}_t$ , then for every  $\eta > 0$

$$(2.38) \quad \Pr \left\{ \bigcup_{t=1}^n A_t | \mathcal{F}_0 \right\} \leq \eta + \Pr \left\{ \sum_{t=1}^n P(A_t | \mathcal{F}_{t-1}) > \eta | \mathcal{F}_0 \right\}.$$

For every  $\varepsilon > 0$ ,  $\eta > 0$

$$(2.39) \quad \begin{aligned} \Pr \left\{ \max_{t=1, \dots, n} z_t' (D_n D_n')^{-1} z_t > \varepsilon | \mathcal{F}_0 \right\} &= \Pr \left\{ \bigcup_{t=1}^n [z_t' (D_n D_n')^{-1} z_t > \varepsilon | \mathcal{F}_0] \right\} \\ &\leq \eta + \Pr \left\{ \sum_{t=1}^n \Pr (z_t' (D_n D_n')^{-1} z_t > \varepsilon | \mathcal{F}_{t-1}) > \eta | \mathcal{F}_0 \right\} \\ &\leq \eta + \Pr \left\{ \frac{1}{n} \sum_{t=1}^n \mathcal{E} [z_t' (D_n D_n')^{-1} z_t I [z_t' (D_n D_n')^{-1} z_t > \varepsilon | \mathcal{F}_{t-1}] > \eta | \mathcal{F}_0 \right\} \end{aligned}$$

by a form of Tchebycheff's inequality. By (2.37) the right-hand side of (2.39) converges to 0. Since  $\eta$  is arbitrary, (2.3) holds. ■

**Corollary 1.** Let  $\{z_t, v_t\}$ ,  $t = 1, 2, \dots$ , be a sequence of pairs of random vectors, and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_{t-1}$ -measurable and  $v_t$  is  $\mathcal{F}_t$ -measurable. Let  $D_n$  be  $\mathcal{F}_0$ -measurable such that (2.2) and (2.37) hold. Suppose that  $\mathcal{E}(v_t | \mathcal{F}_{t-1}) = 0$  a.s.,  $\mathcal{E}(v_t v_t' | \mathcal{F}_{t-1}) = \Sigma_t$  a.s., and (2.4) and (2.5) hold. Then (2.6) holds.

The condition (2.4) determines the limiting covariance matrix of  $D_n^{-1} \sum_{t=1}^n z_t v_t'$ .

**Lemma 2.** Let  $\{z_t, v_t\}$  be a sequence of random vectors, and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_{t-1}$ -measurable and  $v_t$  is  $\mathcal{F}_t$ -measurable such that  $\mathcal{E}(v_t | \mathcal{F}_{t-1}) = 0$  a.s.,  $\mathcal{E}(v_t v_t' | \mathcal{F}_{t-1}) = \Sigma_t$  a.s., and  $\Sigma_t \rightarrow \Sigma$  a.s., where  $\Sigma$  is a constant matrix. Suppose  $D_n$  is  $\mathcal{F}_0$ -measurable such that (2.2) holds. Then (2.4) and (2.26) hold. If, further, (2.3) and (2.5) hold, then (2.6) holds.

The homoscedastic case,  $\Sigma_t = \Sigma$ , is included and also the case of  $\Sigma_t$  nonstochastic.

An important case of  $\{z_t\}$  is that in which  $D_n = \sqrt{n} I$ ; then  $D_n^{-1} \sum_{t=1}^n z_t z_t' (D_n')^{-1} = (1/n) \sum_{t=1}^n z_t z_t'$ ; that is, this matrix is simply the sample covariance matrix for known mean 0.

**Corollary 2.** Let  $\{z_t, v_t\}$  be a sequence of pairs of random vectors and let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $z_t$  is  $\mathcal{F}_{t-1}$ -measurable and  $v_t$  is  $\mathcal{F}_t$ -measurable. Suppose

$$(2.40) \quad \frac{1}{n} \sum_{t=1}^n z_t z_t' \xrightarrow{p} M,$$

a constant matrix.

$$(2.41) \quad \frac{1}{n} \max_{t=1, \dots, n} z_t' z_t \xrightarrow{p} 0,$$

$$\mathcal{E}(v_t | \mathcal{F}_{t-1}) = 0 \text{ a.s.}, \mathcal{E}(v_t v_t' | \mathcal{F}_{t-1}) = \Sigma_t \text{ a.s.},$$

$$(2.42) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \oplus z_t z_t') \xrightarrow{p} \Sigma \oplus M,$$

and (2.5) holds. Then

$$(2.43) \quad \frac{1}{\sqrt{n}} \text{vec} \left( \sum_{t=1}^n z_t v_t' \right) \xrightarrow{\mathcal{L}} N(0, \Sigma \oplus M);$$

if, further,  $M$  is nonsingular, then

$$(2.44) \quad \sqrt{n} \text{vec}(\hat{B}_n - B) \xrightarrow{\mathcal{L}} N(0, M^{-1} \otimes \Sigma);$$

and if, further, (2.26) holds, then (2.32) holds.

Condition (2.40) is equivalently  $(1/n) \sum_{t=1}^n \text{vec } z_t z_t' \xrightarrow{P} \text{vec } M$ ; (2.26) is equivalently  $(1/n) \text{vec } \Sigma_t \xrightarrow{P} \text{vec } \Sigma$ ; and (2.42) is equivalently

$$(2.45) \quad \frac{1}{n} \sum_{t=1}^n \text{vec } \Sigma_t (\text{vec } z_t z_t')' - \frac{1}{n} \sum_{t=1}^n \text{vec } \Sigma_t \left( \frac{1}{n} \sum_{t=1}^n \text{vec } z_t z_t' \right)' \xrightarrow{P} 0.$$

The condition (2.45) is that  $\text{vec } \Sigma_t$  and  $\text{vec } z_t z_t'$  are asymptotically uncorrelated over  $t$ . Even if the  $\Sigma_t$ 's are nonstochastic and the  $z_t$  are exogenous this condition is needed to obtain  $\Sigma \otimes M$  as the covariance matrix of  $(1/\sqrt{n}) \text{vec } \sum_{t=1}^n z_t v_t'$ .

### 3. Robustness in Autoregression.

We now consider the autoregressive model.

$$(3.1) \quad x_t = Bx_{t-1} + v_t, \quad t = 1, 2, \dots$$

The form of (3.1) is (2.1) with  $z_t$  replaced by  $x_{t-1}$ . We shall show that the least squares estimator of  $B$  based on  $x_0, \dots, x_n$  has the asymptotic normal distribution of the least squares estimator in the regression case. In order to show the analogies to (2.2) and (2.3) we prove the following lemmas.

**Lemma 3.** If the characteristic roots of  $B$  are less than 1 in absolute value and if  $\max_{t=1, \dots, n} v_t' v_t / n \xrightarrow{P} 0$ , then for  $x_1, x_2, \dots$  generated by (3.1)

$$(3.2) \quad \frac{1}{n} \max_{t=1, \dots, n} x_{t-1}' x_{t-1} \xrightarrow{P} 0.$$

**Proof.** Since  $x_0' x_0 / n \xrightarrow{P} 0$  and the roots of  $B$  are less than 1 in absolute value,  $x_0' (B')^{t-1} B^{t-1} x_0 / n \xrightarrow{P} 0$  and we need only consider

$$(3.3) \quad x_{t-1}^* = \sum_{s=0}^{t-2} B^s v_{t-1-s}.$$

Then

$$\begin{aligned}
 (3.4) \quad \mathbf{x}_{t-1}^{*'} \mathbf{x}_{t-1}^* &= \sum_{r,s=0}^{t-2} \mathbf{v}_{t-r-1}' (B')^r B^s \mathbf{v}_{t-s-1} \\
 &\leq \sum_{r,s=0}^{t-2} |\mathbf{v}_{t-r-1}' (B')^r B^s \mathbf{v}_{t-s-1}| \\
 &\leq \sum_{r,s=0}^{t-2} \lambda^{r+s} q r^{p-1} s^{p-1} (\|\mathbf{v}_{t-r-1}\|^2 + \|\mathbf{v}_{t-s-1}\|^2),
 \end{aligned}$$

where  $\lambda$  is the largest absolute value of the characteristic roots of  $B$  and  $q$  is a suitable constant. (See Lemma 7 in the appendix.) Then

$$(3.5) \quad \frac{1}{n} \max_{t=1, \dots, n} \|\mathbf{x}_{t-1}^*\|^2 \leq \frac{2q}{n} \max_{t=1, \dots, n} \|\mathbf{v}_t\|^2 \left( \sum_{s=0}^{n-2} \lambda^s s^{p-1} \right)^2.$$

Since the sum in (3.5) is bounded as  $n \rightarrow \infty$ , (3.2) follows. ■

**Lemma 4.** Let  $\mathbf{x}_1, \mathbf{x}_2, \dots$  be generated by (3.1) with and  $\mathcal{E}\mathbf{x}_0\mathbf{x}_0' = \Sigma_0$ . Let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $\mathbf{x}_t$  and  $\mathbf{v}_t$  are  $\mathcal{F}_t$ -measurable. Suppose the characteristic roots of  $B$  are less than 1 in absolute value,  $\mathcal{E}(\mathbf{v}_t | \mathcal{F}_{t-1}) = \mathbf{0}$  a.s.,  $\mathcal{E}(\mathbf{v}_t \mathbf{v}_t' | \mathcal{F}_{t-1}) = \Sigma_t$  a.s., (2.26) holds with  $\Sigma$  constant, and (2.27) holds. Define

$$(3.6) \quad \Gamma = \sum_{s=0}^{\infty} B^s \Sigma (B')^s.$$

Then (2.28) holds,

$$(3.7) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{v}_t \mathbf{x}_{t-1}' \xrightarrow{p} \mathbf{0},$$

$$(3.8) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{x}_{t-1}' \xrightarrow{p} \Gamma.$$

**Proof.** From (3.1) we have

$$(3.9) \quad \mathbf{x}_{t-1} = \sum_{s=0}^{t-2} B^s \mathbf{v}_{t-1-s} + B^{t-1} \mathbf{x}_0.$$

For some  $\theta > 0$  define  $\mathbf{x}_{n0} = \mathbf{x}_0$ .

$$(3.10) \quad \mathbf{v}_{nt} = \mathbf{v}_t I \left[ \text{tr} \sum_{s=1}^t \Sigma_s \leq n(1 + \theta) \text{tr} \Sigma_s \right].$$

$$(3.11) \quad \mathbf{x}_{n,t-1} = \sum_{s=0}^{t-2} B^s \mathbf{v}_{n,t-1-s} + B^{t-1} \mathbf{x}_{n0}.$$

Then

$$(3.12) \quad \Pr \{ \mathbf{v}_{nt} = \mathbf{v}_t, t = 1, \dots, n \} \xrightarrow{P} 1.$$

$$(3.13) \quad \Pr \{ \mathbf{x}_{n,t-1} = \mathbf{x}_{t-1}, t = 1, \dots, n \} \xrightarrow{P} 1,$$

$$(3.14) \quad \Pr \{ \mathbf{v}_{nt} \mathbf{x}'_{n,t-1} = \mathbf{v}_t \mathbf{x}'_{t-1}, t = 1, \dots, n \} \xrightarrow{P} 1.$$

By construction  $\mathcal{E} \|\mathbf{v}_{nt}\|^2 \leq n(1 + \theta) \text{tr} \Sigma$  and  $\mathcal{E} \|\mathbf{x}_{n,t-1}\|^2 < \infty$ . Then

$$(3.15) \quad \begin{aligned} \text{tr} \mathcal{E} \left( \frac{1}{n} \sum_{t=1}^n \mathbf{v}_{nt} \mathbf{x}'_{n,t-1} \right) \left( \frac{1}{n} \sum_{s=1}^n \mathbf{x}_{n,s-1} \mathbf{v}'_{ns} \right) \\ &= \frac{1}{n^2} \mathcal{E} \text{tr} \sum_{s,t=1}^n \mathbf{v}_{nt} \mathbf{x}'_{n,t-1} \mathbf{x}_{n,s-1} \mathbf{v}'_{ns} \\ &= \frac{1}{n^2} \text{tr} \mathcal{E} \sum_{s,t=1}^n \mathbf{x}'_{n,t-1} \mathbf{x}_{n,s-1} \mathbf{v}'_{ns} \mathbf{v}_{nt} \\ &= \frac{1}{n^2} \mathcal{E} \sum_{s,t=1}^n \mathbf{x}'_{n,t-1} \mathbf{x}_{n,s-1} \mathcal{E} (\mathbf{v}'_{ns} \mathbf{v}_{nt} | \mathcal{F}_{\max(s,t)-1}) \\ &= \frac{1}{n^2} \mathcal{E} \sum_{t=1}^n \mathbf{x}'_{n,t-1} \mathbf{x}_{n,t-1} \mathcal{E} (\mathbf{v}'_{nt} \mathbf{v}_{nt} | \mathcal{F}_{t-1}). \end{aligned}$$

Since  $\max_{t=1, \dots, n} \|\mathbf{v}_t\|^2/n \xrightarrow{P} 0$  by Theorem 4, we have  $\max_{t=1, \dots, n} \mathcal{E}(\|\mathbf{v}_{nt}\|^2 | \mathcal{F}_{t-1})/n \xrightarrow{P} 0$  by (3.6). Now consider for  $2 \leq t \leq n-1$

$$(3.16) \quad \begin{aligned} \frac{1}{n} \mathcal{E} \sum_{t=1}^n \mathbf{x}_{n,t-1} \mathbf{x}'_{n,t-1} \\ &= \frac{1}{n} \mathcal{E} \left[ \mathbf{x}_0 \mathbf{x}'_0 + \sum_{t=2}^n \left( \sum_{r=0}^{t-2} B^r \mathbf{v}_{n,t-r-1} + B^{t-1} \mathbf{x}_0 \right) \left( \sum_{s=0}^{t-2} B^s \mathbf{v}_{n,t-s-1} + B^{t-1} \mathbf{x}_0 \right)' \right] \\ &= \frac{1}{n} \sum_{t=2}^n \sum_{s=0}^{t-2} B^s \mathcal{E} \mathbf{v}_{n,t-s-1} \mathbf{v}'_{n,t-s-1} (B')^s + \frac{1}{n} \sum_{t=1}^n B^{t-1} \Sigma_0 (B')^{t-1} \\ &= \sum_{s=0}^{n-2} B^s \frac{1}{n} \sum_{t=s+2}^n \mathcal{E} \mathbf{v}_{n,t-s-1} \mathbf{v}'_{n,t-s-1} (B')^s + \frac{1}{n} \sum_{t=1}^n B^{t-1} \Sigma_0 (B')^{t-1}. \end{aligned}$$

The trace of the first term on the right-hand side of (3.6) is not greater than  $(1 + \theta) \text{tr } \Gamma$ . Hence, (3.5)  $\rightarrow 0$ , and (3.7) is proved.

From (2.28) and (3.1) we have

$$(3.17) \quad \frac{1}{n} \sum_{t=1}^n v_t v'_t = \frac{1}{n} \sum_{t=1}^n (x_t x'_t - x_t x'_{t-1} B' - B x_t x'_{t-1} + B x_{t-1} x'_{t-1} B') \\ \xrightarrow{P} \Sigma.$$

From (3.7) and (3.1) we have

$$(3.18) \quad \frac{1}{n} \sum_{t=1}^n v_t x'_{t-1} = \frac{1}{n} \sum_{t=1}^n (x_t x'_{t-1} - B x_{t-1} x'_{t-1}) \\ \xrightarrow{P} 0.$$

If we add to (3.17) the result of multiplying (3.18) on the right by  $B'$  and the transpose of that product, we obtain

$$(3.19) \quad \frac{1}{n} \sum_{t=1}^n v_t v'_t + \frac{1}{n} \sum_{t=1}^n v_t x'_{t-1} B' + \frac{1}{n} B \sum_{t=1}^n x_{t-1} v'_t \\ = \frac{1}{n} \sum_{t=1}^n x_t x'_t - B \frac{1}{n} \sum_{t=1}^n x_{t-1} x'_{t-1} B' \\ \xrightarrow{P} \Sigma.$$

Furthermore, Lemma 3 implies

$$(3.20) \quad \frac{1}{n} \sum_{t=1}^n x_t x'_t - \frac{1}{n} \sum_{t=1}^n x_{t-1} x'_{t-1} = \frac{1}{n} x_n x'_n - \frac{1}{n} x_0 x'_0 \xrightarrow{P} 0$$

Then (3.19) is equivalent to

$$(3.21) \quad \frac{1}{n} \sum_{t=1}^n x_t x'_t - B \frac{1}{n} \sum_{t=1}^n x_{t-1} x'_{t-1} B' \xrightarrow{P} \Sigma,$$

which implies

$$(3.22) \quad \Gamma = \text{plim}_{n \rightarrow \infty} \frac{1}{n} \sum_{t=1}^n x_t x'_t = \text{plim}_{n \rightarrow \infty} \frac{1}{n} \sum_{t=1}^n x_{t-1} x'_{t-1}.$$

See Problem 27 of Chapter 5 of Anderson (1971). Then (3.4) follows. ■

**Theorem 5.** Let  $\mathbf{x}_1, \mathbf{x}_2, \dots$  be generated by (3.1), where  $\mathbf{v}_1, \mathbf{v}_2, \dots$  is a sequence of random vectors and  $\mathcal{E}\mathbf{x}_0\mathbf{x}'_0 = \Sigma_0$ . Let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $\mathbf{x}_t$  and  $\mathbf{v}_t$  are  $\mathcal{F}_t$ -measurable. Suppose that the characteristic roots of  $\mathbf{B}$  are less than 1 in absolute value.  $\mathcal{E}(\mathbf{v}_t|\mathcal{F}_{t-1}) = \mathbf{0}$  a.s.  $\mathcal{E}(\mathbf{v}_t\mathbf{v}'_t|\mathcal{F}_{t-1}) = \Sigma_t$  a.s., (2.26) holds with  $\Sigma$  constant, and (2.5) holds. Furthermore, suppose

$$(3.23) \quad \frac{1}{n} \sum_{t=\max(r,s)+2}^n (\Sigma_t \odot \mathbf{v}_{t-1-r}\mathbf{v}'_{t-1-s}) \xrightarrow{P} \delta_{rs}(\Sigma \odot \Sigma),$$

where  $\delta_{ss} = 1$  and  $\delta_{rs} = 0$  for  $r \neq s$ . Then

$$(3.24) \quad \frac{1}{\sqrt{n}} \text{vec} \left( \sum_{t=1}^n \mathbf{x}_{t-1}\mathbf{v}'_t \right) \xrightarrow{\mathcal{L}} N(\mathbf{0}, \Sigma \otimes \Gamma).$$

**Proof.** In Corollary 2 we take  $\mathbf{z}_t = \mathbf{x}_{t-1}$ . We want to verify (2.40), (2.41), and (2.42); (2.5) is assumed. Since (2.5) implies (2.27), Lemma 4 includes (3.8), which is equivalent to (2.40).

We have

$$(3.25) \quad \begin{aligned} & \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes \mathbf{x}_{t-1}\mathbf{x}'_{t-1}) \\ &= \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \otimes \left( \sum_{i=0}^{t-2} \mathbf{B}^i \mathbf{v}_{t-i-1} + \mathbf{B}^{t-1} \mathbf{x}_0 \right) \left( \sum_{s=0}^{t-2} \mathbf{B}^s \mathbf{v}_{t-s-1} + \mathbf{B}^{t-1} \mathbf{x}_0 \right)' \right] \end{aligned}$$

If we define  $\mathbf{v}_0 = \mathbf{v}_{-1} = \dots = \mathbf{0}$ , we can write

$$(3.26) \quad \begin{aligned} \sum_{s=0}^{t-2} \mathbf{B}^s \mathbf{v}_{t-s-1} + \mathbf{B}^{t-1} \mathbf{x}_0 &= \sum_{s=0}^{\infty} \mathbf{B}^s \mathbf{v}_{t-s-1} + \mathbf{B}^{t-1} \mathbf{x}_0 \\ &= \sum_{s=0}^k \mathbf{B}^s \mathbf{v}_{t-s-1} + \sum_{s=k+1}^{\infty} \mathbf{B}^s \mathbf{v}_{t-s-1} + \mathbf{B}^{t-1} \mathbf{x}_0. \end{aligned}$$

For  $t \geq p+1$

$$(3.27) \quad \|\mathbf{B}^{t-1} \mathbf{x}_0\| \leq 2\lambda^{2(t-1)} q(t-1)^{p-1} \|\mathbf{x}_0\|^2.$$

Hence

$$(3.28) \quad \frac{1}{n} \sum_{t=1}^n [\Sigma_t \otimes B^{t-1} \mathbf{x}_0 \mathbf{x}_0' (B')^{t-1}] \xrightarrow{P} \mathbf{0}.$$

(See Lemma 8 in the Appendix.)

Consider the positive semidefinite matrix

$$(3.29) \quad \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \otimes \sum_{r,s=k+1}^{\infty} B^r \mathbf{v}_{t-r-1} \mathbf{v}_{t-s-1}' (B')^s \right].$$

We shall show that with arbitrarily high probability the trace of (3.28) is arbitrarily small if  $k$  is large enough. That will follow by showing the same property of

$$(3.30) \quad \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_{nt} \otimes \sum_{r,s=k+1}^{\infty} B^r \mathbf{v}_{n,t-r-1} \mathbf{v}_{n,t-s-1}' (B')^s \right],$$

where  $\Sigma_{nt} = \mathcal{E}(\mathbf{v}_{nt} \mathbf{v}_{nt}' | \mathcal{F}_{t-1})$ . The expected value of the trace of the second matrix in (3.30) is

$$\begin{aligned} (3.31) \quad & \mathcal{E} \sum_{r,s=k+1}^{\infty} \text{tr } B^r \mathbf{v}_{n,t-r-1} \mathbf{v}_{n,t-s-1}' (B')^s \\ &= \mathcal{E} \sum_{s=k+1}^{\infty} \mathbf{v}_{n,t-s-1}' (B')^s B^r \mathbf{v}_{n,t-r-1} \\ &\leq \sum_{s=k+1}^{\infty} \lambda^{2s} q^* s^{2p} \mathcal{E} \mathbf{v}_{n,t-s-1}' \mathbf{v}_{n,t-s-1} \\ &= q^* \sum_{s=k+1}^{\infty} \lambda^{2s} s^{2p} \mathcal{E} \left\{ \mathcal{E} [\mathbf{v}_{n,t-s-1}' \mathbf{v}_{n,t-s-1} I(\mathbf{v}_{n,t-s-1}' \mathbf{v}_{n,t-s-1} \leq a) | \mathcal{F}_{t-s-2}] \right. \\ &\quad \left. + \mathcal{E} [\mathbf{v}_{n,t-s-1}' \mathbf{v}_{n,t-s-1} I(\mathbf{v}_{n,t-s-1}' \mathbf{v}_{n,t-s-1} > a) | \mathcal{F}_{t-s-2}] \right\} \\ &\leq q^* \sum_{s=k+1}^{\infty} \lambda^{2s} s^{2p} \left\{ a + \mathcal{E} \sup_{t=1,2,\dots} \mathcal{E} [\mathbf{v}_{nt}' \mathbf{v}_{nt} I(\mathbf{v}_{nt}' \mathbf{v}_{nt} > a) | \mathcal{F}_{t-1}] \right\}. \end{aligned}$$

Since  $\sum_{s=k+1}^{\infty} \lambda^{2s} s^{2p}$  converges, the second part of the right-hand side of (3.31) can be made arbitrarily small by taking  $a$  large enough; the first term can be made arbitrarily small by making  $k$  sufficiently large. Thus (3.31) is arbitrarily small, and by Tchebycheff's inequality the second matrix in (3.30) is arbitrarily small with arbitrarily high probability.

Now

$$(3.32) \quad \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \odot \sum_{r,s=0}^k B^r v_{t-r-1} v'_{t-s-1} (B')^s \right] \xrightarrow{p} \Sigma \otimes \sum_{s=0}^k B^s \Sigma (B')^s.$$

If the right-hand side of (3.26) is written as  $a_t + b_t + c_t$ , we have shown above that

$$(3.33) \quad \frac{1}{n} \sum_{t=1}^n \Sigma_t \otimes b_t b'_t \xrightarrow{p} 0$$

and that

$$(3.34) \quad \text{tr} \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes c_t c'_t)$$

can be made to converge in probability as  $n \rightarrow \infty$  to an arbitrarily small quantity. It follows from the Cauchy-Schwarz inequality that

$$(3.35) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes a_t c'_t) \xrightarrow{p} 0,$$

$$(3.36) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes b_t c'_t) \xrightarrow{p} 0,$$

and that

$$(3.37) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes a_t b'_t)$$

can be made to converge in probability to an arbitrarily small quantity. Hence,

$$(3.38) \quad \frac{1}{n} \sum_{t=1}^n [\Sigma_t \otimes x_{t-1} x'_{t-1}] \xrightarrow{p} \Sigma \otimes \Gamma.$$

Hence, by Corollary 2 (3.24) follows. ■

The least squares estimator of  $B$  is

$$(3.39) \quad \hat{B}_n = \sum_{t=1}^n x_t x'_{t-1} \left( \sum_{t=1}^n x_{t-1} x'_{t-1} \right)^{-1},$$

and the estimator of  $\Sigma$  is

$$(3.40) \quad \begin{aligned} \hat{\Sigma}_n &= \frac{1}{n} \sum_{t=1}^n (\mathbf{x}_t - \hat{B}_n \mathbf{x}_{t-1})(\mathbf{x}_t - \hat{B}_n \mathbf{x}_{t-1})' \\ &= \frac{1}{n} \sum_{t=1}^n \mathbf{v}_t \mathbf{v}_t' - (\hat{B}_n - B) \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{x}_{t-1}' (\hat{B}_n - B)'. \end{aligned}$$

**Corollary 3.** Suppose the conditions of Theorem 5 hold and  $\Gamma$  is nonsingular. Then

$$(3.41) \quad \sqrt{n} \text{vec}(\hat{B}_n - B) \xrightarrow{\mathcal{L}} N(\mathbf{0}, \Gamma^{-1} \otimes \Sigma),$$

and (2.32) holds.

The conditions (3.23) in autoregression replace condition (2.4) in regression; they imply (3.38) which is the analog of (2.4). The limit (3.38) is that  $\text{vec } \Sigma_t$  and  $\text{vec } \mathbf{x}_{t-1} \mathbf{x}_{t-1}'$  are asymptotically uncorrelated. The condition holds identically in  $B$ ; the conditions (3.23) are independent of  $B$ .

**Corollary 4.** Under the conditions of Theorem 5 with (2.26) and (3.23) replaced by  $\Sigma_t \rightarrow \Sigma$  a.s., (3.24) holds. If  $\Gamma$  is nonsingular, (3.41) and (2.32) hold.

**Proof.** The condition  $\Sigma_t \rightarrow \Sigma$  a.s., where  $\Sigma$  is constant, implies (2.26) and (3.23).

■

A higher order autoregressive process can be reduced to the first-order process. Suppose  $X_1, X_2, \dots$  satisfy

$$(3.42) \quad X_t = B_1 X_{t-1} + \dots + B_p X_{t-p} + V_t, t = 1, 2, \dots$$

Define

$$(3.43) \quad \mathbf{x}_t = \begin{bmatrix} X_t \\ X_{t-1} \\ \vdots \\ X_{t-p+1} \end{bmatrix}, \mathbf{v}_t = \begin{bmatrix} V_t \\ 0 \\ \vdots \\ 0 \end{bmatrix},$$

$$(3.44) \quad B = \begin{bmatrix} B_1 & B_2 & B_3 & \cdots & B_p \\ I & 0 & 0 & \cdots & 0 \\ 0 & I & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 \end{bmatrix}, \Sigma_t = \begin{bmatrix} \Omega_t & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 \end{bmatrix},$$

where  $\mathcal{E}(V_t | \mathcal{F}_{t-1}) = 0$  a.s.,  $\mathcal{E}(V_t V_t' | \mathcal{F}_{t-1}) = \Omega_t$  a.s., and  $\{\mathcal{F}_t\}$  is an increasing  $\sigma$ -field such that  $X_t$  and  $V_t$  are  $\mathcal{F}_t$ -measurable. Then  $\{x_t\}$  satisfies (3.1).

**Theorem 6.** Let

$$(3.45) \quad \mathcal{E} \begin{bmatrix} X_0 \\ X_{-1} \\ \vdots \\ X_{-p+1} \end{bmatrix} [X'_0, X'_{-1}, \dots, X'_{-p+1}] = \Phi,$$

and let  $X_1, X_2, \dots$  be generated by (3.42). Let  $\{\mathcal{F}_t\}$  be an increasing sequence of  $\sigma$ -fields such that  $X_t$  and  $V_t$  are  $\mathcal{F}_t$ -measurable. Suppose the roots of

$$(3.46) \quad |\lambda^p I - \lambda^{p-1} B_1 - \cdots - B_p| = 0$$

are less than 1 in absolute value,  $\mathcal{E}(V_t | \mathcal{F}_{t-1}) = 0$  a.s.,  $\mathcal{E}(V_t V_t' | \mathcal{F}_{t-1}) = \Omega_t$  a.s.,

$$(3.47) \quad \frac{1}{n} \sum_{t=1}^n \Omega_t \xrightarrow{p} \Omega,$$

which is nonsingular and constant, and (2.5) holds with  $v_t$  replaced by  $V_t$ . Define

$$(3.48) \quad (\hat{B}_{1n}, \hat{B}_{2n}, \dots, \hat{B}_{pn}) = \sum_{t=1}^n X_t (X'_{t-1}, X'_{t-2}, \dots, X'_{t-p}) \\ \times \begin{bmatrix} \sum_{t=1}^n X_{t-1} X'_{t-1} & \sum_{t=1}^n X_{t-1} X'_{t-2} & \cdots & \sum_{t=1}^n X_{t-1} X'_{t-p} \\ \sum_{t=1}^n X_{t-2} X'_{t-1} & \sum_{t=1}^n X_{t-2} X'_{t-2} & \cdots & \sum_{t=1}^n X_{t-2} X'_{t-p} \\ \vdots & \vdots & \ddots & \vdots \\ \sum_{t=1}^n X_{t-p} X'_{t-1} & \sum_{t=1}^n X_{t-p} X'_{t-2} & \cdots & \sum_{t=1}^n X_{t-p} X'_{t-p} \end{bmatrix}^{-1},$$

$$(3.49) \quad \hat{\Omega}_n = \frac{1}{n} \sum_{t=1}^n (X_t - \hat{B}_{1n} X_{t-1} - \cdots - \hat{B}_{pn} X_{t-p})(X_t - \hat{B}_{1n} X_{t-1} - \cdots - \hat{B}_{pn} X_{t-p})'.$$

Then

$$(3.50) \quad \hat{\Omega}_n \xrightarrow{p} \Omega,$$

$$(3.51) \quad \frac{1}{n} \sum_{t=1}^n \begin{bmatrix} X_{t-1} \\ X_{t-2} \\ \vdots \\ X_{t-p} \end{bmatrix} [X'_{t-1}, X'_{t-2}, \dots, X'_{t-p}] \xrightarrow{p} \sum_{s=0}^{\infty} B^s \Sigma (B')^s = \Gamma,$$

say, where

$$(3.52) \quad \Sigma = \begin{bmatrix} \Omega & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & 0 \end{bmatrix},$$

and

$$(3.53) \quad \sqrt{n} \text{vec}(\hat{B}_{1n} - B_1, \dots, \hat{B}_{pn} - B_p) \xrightarrow{\mathcal{L}} N(0, \Gamma^{-1} \otimes \Omega).$$

**Lemma 5.** If  $\Omega$  is nonsingular,  $\Gamma$  is nonsingular.

**Proof.** The proof is a vector generalization of the proof of Lemma 5.5.5 of Anderson (1971). ■

#### 4. Robustness in Mixed Regression and Autoregression

Now we consider the model

$$(4.1) \quad \mathbf{x}_t = B\mathbf{x}_{t-1} + \Delta\mathbf{z}_t + \mathbf{v}_t, \quad t = 1, 2, \dots$$

This model is analogous to the regression model (2.1) with  $\mathbf{z}_t$  replaced by  $(\mathbf{x}'_{t-1}, \mathbf{z}'_t)'$ . The least squares estimator of  $(B, \Delta)$  is

$$(4.2) \quad (\hat{B}_n, \hat{\Delta}_n) = \left( \sum_{t=1}^n \mathbf{x}_t \mathbf{x}'_{t-1}, \sum_{t=1}^n \mathbf{x}_t \mathbf{z}'_t \right) \left[ \begin{array}{cc} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{x}'_{t-1} & \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{z}'_t \\ \sum_{t=1}^n \mathbf{z}_t \mathbf{x}'_{t-1} & \sum_{t=1}^n \mathbf{z}_t \mathbf{z}'_t \end{array} \right]^{-1},$$

and the estimator of  $\Sigma$  is

$$(4.3) \quad \hat{\Sigma}_n = \frac{1}{n} \sum_{t=1}^n (\mathbf{x}_t - \hat{B}_n \mathbf{x}_{t-1} - \hat{\Delta}_n \mathbf{z}_t)(\mathbf{x}_t - \hat{B}_n \mathbf{x}_{t-1} - \hat{\Delta}_n \mathbf{z}_t)'$$

**Theorem 7.** Let  $\mathcal{E} \mathbf{x}_0 \mathbf{x}'_0 = \Sigma_0$ ; let  $\mathbf{x}_1, \mathbf{x}_2, \dots$  be generated by (4.1), and let  $\mathbf{z}_1, \mathbf{z}_2, \dots$  be a sequence of random variables (possibly degenerate). Let  $\{\mathcal{F}_t\}$  be a sequence of increasing  $\sigma$  fields such that  $\mathbf{v}_t$  is  $\mathcal{F}_t$ -measurable and  $\mathbf{z}_t$  is  $\mathcal{F}_{t-1}$ -measurable. Suppose the characteristic roots of  $\mathbf{B}$  are less than 1 in absolute value,  $\mathcal{E}(\mathbf{v}_t | \mathcal{F}_{t-1}) = \mathbf{0}$  a.s.,  $\mathcal{E}(\mathbf{v}_t \mathbf{v}'_t | \mathcal{F}_{t-1}) = \Sigma_t$  a.s., and (2.5), (2.26), and (2.41) hold. Suppose

$$(4.4) \quad \frac{1}{n} \sum_{t=1}^{n-h} \mathbf{z}_{t+h} \mathbf{z}'_t \xrightarrow{p} \mathbf{M}_h = \mathbf{M}'_{-h}, \quad h = 0, 1, 2, \dots,$$

$$(4.5) \quad \frac{1}{n} \sum_{t=1}^{n-h} \mathbf{z}_{t+h} \mathbf{v}'_t \xrightarrow{p} \mathbf{0}, \quad h = 1, 2, \dots$$

Define

$$(4.6) \quad \mathbf{L} = \sum_{s=0}^{\infty} \mathbf{B}^s \Delta \mathbf{M}_{-(s+1)}.$$

Then

$$(4.7) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{z}'_t \xrightarrow{p} \mathbf{L},$$

$$(4.8) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{x}'_{t-1} \xrightarrow{p} \mathbf{Q},$$

where  $\mathbf{Q}$  is the unique solution to

$$(4.9) \quad \mathbf{Q} - \mathbf{B} \mathbf{Q} \mathbf{B}' = \Sigma + \mathbf{B} \mathbf{L} \Delta' + \Delta \mathbf{L}' \mathbf{B}' + \Delta \mathbf{M}_0 \Delta'.$$

Furthermore, if (2.42) and (3.23) hold and

$$(4.10) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \oplus \mathbf{v}_{t-1-s} \mathbf{z}'_t) \xrightarrow{p} \mathbf{0}, \quad s = 1, 2, \dots$$

then

$$(4.11) \quad \sqrt{n} \text{vec}(\hat{\mathbf{B}}_n - \mathbf{B}, \hat{\Delta}_n - \Delta) \xrightarrow{\mathcal{L}} N \left[ \begin{pmatrix} \mathbf{0} \\ \mathbf{0} \end{pmatrix}, \begin{pmatrix} \mathbf{Q} & \mathbf{L} \\ \mathbf{L}' & \mathbf{M}_0 \end{pmatrix}^{-1} \oplus \Sigma \right].$$

and (2.32) holds under the further assumption that the inverse matrix in (4.11) exists.

**Proof.** Because the roots of  $B$  are less than 1 in absolute value, the sum in (4.6) converges (by use of the Cauchy-Schwarz inequality). From (4.1) we obtain

$$\begin{aligned}
 (4.12) \quad x_{t-1} &= \sum_{s=0}^{t-2} B^s v_{t-1-s} + B^{t-1} x_0 + \sum_{s=0}^{t-2} B^s \Delta z_{t-1-s} \\
 &= \sum_{s=0}^k B^s v_{t-1-s} + \sum_{s=k+1}^{\infty} B^s v_{t-1-s} + B^{t-1} x_0 \\
 &\quad + \sum_{s=0}^k B^s \Delta z_{t-1-s} + \sum_{s=k+1}^{\infty} B^s \Delta z_{t-1-s}.
 \end{aligned}$$

where  $v_0 = v_{-1} = \dots = 0$  and  $z_0 = z_{-1} = \dots = 0$ . Then

$$\begin{aligned}
 (4.13) \quad \frac{1}{n} \sum_{t=1}^n x_{t-1} z'_t &= \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^k B^s (v_{t-1-s} + \Delta z_{t-1-s}) z'_t \\
 &\quad + \frac{1}{n} \sum_{t=1}^n \left[ B^{t-1} x_0 z'_t + \sum_{s=k+1}^{\infty} B^s (v_{t-1-s} + \Delta z_{t-1-s}) z'_t \right].
 \end{aligned}$$

We calculate by use of Lemma 7

$$\begin{aligned}
 (4.14) \quad \left| \frac{1}{n} \sum_{t=1}^n \sum_{s=k+1}^{\infty} B^s v_{t-1-s} z'_t \right| &\leq \frac{1}{n} \sum_{t=1}^n \sum_{s=k+1}^{\infty} \lambda^s s^{p-1} q^{**} (\|v_{t-1-s}\|^2 + \|z_t\|^2) \\
 &\leq q^{**} \sum_{s=k+1}^{\infty} \lambda^s s^{p-1} \frac{1}{n} \sum_{t=1}^n (\|v_t\|^2 + \|z_t\|^2).
 \end{aligned}$$

Since  $\sum_{s=0}^{\infty} \lambda^s s^{p-1}$  converges and  $\sum_{t=1}^n \|z_t\|^2 / n \xrightarrow{p} \text{tr } M_0$ , we can choose  $k$  sufficiently large to make the right-hand side of (4.14) arbitrarily small with arbitrarily high probability. Similarly the other two terms in the second sum in (4.13) can be made small. Then

$$(4.15) \quad \frac{1}{n} \sum_{s=0}^k B^s (v_{t-1-s} + \Delta z_{t-1-s}) z'_t \xrightarrow{p} \frac{1}{n} \sum_{s=0}^k B^s \Delta M_{-k}.$$

That leads to (4.7).

From (4.1) we have

$$(4.16) \quad \frac{1}{n} \sum_{t=1}^n v_t v'_t = \frac{1}{n} \sum_{t=1}^n \left[ x_t x'_t - B x_{t-1} x'_t - \Delta z_t x'_t \right]$$

$$\begin{aligned}
& -x_t x'_{t-1} B' + B x_{t-1} x'_{t-1} B' + \Delta z_t x'_{t-1} B' \\
& -x_t z'_t \Delta' + B x_{t-1} z'_t \Delta' + \Delta z_t z'_t \Delta'] \\
& \xrightarrow{p} \Sigma.
\end{aligned}$$

$$(4.17) \quad \frac{1}{n} \sum_{t=1}^n v_t x'_{t-1} = \frac{1}{n} \sum_{t=1}^n [x_t x'_{t-1} - B x_{t-1} x'_{t-1} - \Delta z_t x'_{t-1}],$$

$$(4.18) \quad \frac{1}{n} \sum_{t=1}^n v_t z'_t = \frac{1}{n} \sum_{t=1}^n [x_t z'_t - B x_{t-1} z'_t - \Delta z_t z'_t] \xrightarrow{p} 0.$$

If (4.17)  $\xrightarrow{p} 0$ , then from (4.16), (4.17), and (4.18) we obtain

$$\begin{aligned}
(4.19) \quad & \frac{1}{n} \sum_{t=1}^n (x_t x'_t - B x_{t-1} x'_{t-1} B') \\
& = \frac{1}{n} \left[ \sum_{t=1}^n (x_t x'_t - B x_t x'_t B') + B x_n x'_n B' - B x_0 x'_0 B' \right] \\
& \xrightarrow{p} \Sigma + B L \Delta' + \Delta L' B' + \Delta M_0 \Delta'.
\end{aligned}$$

If  $(1/n) x'_n x_n \xrightarrow{p} 0$ , then (4.8) follows from (4.19). Thus

$$(4.20) \quad \frac{1}{n} \sum_{t=1}^n \begin{pmatrix} x_{t-1} \\ z_t \end{pmatrix} (x'_{t-1}, z'_t) \xrightarrow{p} \begin{pmatrix} Q & L \\ L' & M_0 \end{pmatrix}.$$

Now we consider

$$\begin{aligned}
(4.21) \quad & \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes x_{t-1} x'_{t-1}) \\
& = \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \otimes \sum_{r,s=0}^{\infty} B^r (\Delta, I) \begin{pmatrix} z_{t-1-s} \\ v_{t-1-s} \end{pmatrix} (z'_{t-1-s}, v'_{t-1-s}) \begin{pmatrix} \Delta' \\ I \end{pmatrix} (B')^s \right].
\end{aligned}$$

If the sums in (4.21) on  $r, s$  run from  $k+1$  to  $\infty$ , the trace converges to an arbitrarily small quantity by taking  $k$  sufficiently large. Then

$$\begin{aligned}
(4.22) \quad & \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \otimes \sum_{r,s=0}^k B^r (\Delta, I) \begin{pmatrix} z_{t-1-r} \\ v_{t-1-s} \end{pmatrix} (z'_{t-1-s}, v'_{t-1-s}) \begin{pmatrix} \Delta' \\ I \end{pmatrix} (B')^s \right] \\
& \xrightarrow{p} \Sigma \otimes \sum_{r,s=0}^k B^r [\Delta M_{s-r} \Delta' + \delta_{r,s} \Sigma] (B')^s.
\end{aligned}$$

Thus

$$(4.23) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes \mathbf{x}_{t-1} \mathbf{x}'_{t-1}) \xrightarrow{p} \Sigma \otimes \left[ \sum_{r,s=0}^{\infty} B^r \Delta M_{s-r} \Delta' (B')^s + \sum_{s=0}^{\infty} B^s \Sigma (B')^s \right] \\ = \Sigma \otimes Q.$$

By similar means we can complete the proof of

$$(4.24) \quad \frac{1}{n} \sum_{t=1}^n \left[ \Sigma_t \otimes \begin{pmatrix} \mathbf{x}_{t-1} \\ \mathbf{z}_t \end{pmatrix} (\mathbf{x}'_{t-1}, \mathbf{z}'_t) \right] \longrightarrow \begin{pmatrix} Q & L \\ L' & M_0 \end{pmatrix}.$$

Theorem 1 can then be applied with  $\mathbf{z}_t$  in Theorem 1 replaced by  $(\mathbf{x}'_{t-1}, \mathbf{z}'_t)'$  to obtain (4.11), and (2.33) follows.

To apply Theorem 1 we also need

$$(4.25) \quad \frac{1}{n} \max_{t=1, \dots, n} \|\mathbf{x}'_{t-1}\|^2 \xrightarrow{p} 0.$$

To prove this we need only consider

$$(4.26) \quad \mathbf{x}_{t-1}^* = \sum_{s=0}^{t-2} B^s (\mathbf{v}_{t-1-s} + \Delta \mathbf{z}_{t-1-s}).$$

Then

$$(4.27) \quad \mathbf{x}_{t-1}^{*'} \mathbf{x}_{t-1}^* = \left\| \sum_{s=0}^{t-2} B^s (\mathbf{v}_{t-1-s} + \Delta \mathbf{z}_{t-1-s}) \right\|^2 \\ \leq 2 \left\| \sum_{s=0}^{t-2} B^s \mathbf{v}_{t-1-s} \right\|^2 + 2 \left\| \sum_{s=0}^{t-2} B^s \Delta \mathbf{z}_{t-1-s} \right\|^2.$$

By (3.4) the first term on the right-hand side of (4.27) is less than or equal to

$$(4.28) \quad 4 \sum_{r,s=0}^{t-2} \lambda^{r+s} q r^{p-1} s^{p-1} \|\mathbf{v}_{t-1-s}\|^2 \leq 4 \sum_{r,s=0}^{t-2} \lambda^{r+s} q r^{p-1} s^{p-1} \max_{t=1, \dots, n} \|\mathbf{v}_t\|^2.$$

Since  $\|\Delta \mathbf{z}_{t-1-s}\|^2 \leq \text{const} \|\mathbf{z}_{t-1-s}\|^2$ , we obtain

$$(4.29) \quad \|\mathbf{x}_{t-1}^*\|^2 \leq 4 \sum_{r,s=0}^{t-2} \lambda^{r+s} r^{p-1} s^{p-1} \left( q \max_{t=1, \dots, n} \|\mathbf{v}_t\|^2 + q * \max_{t=1, \dots, n} \|\mathbf{z}_t\|^2 \right),$$

which implies (4.25) and  $\|\mathbf{x}_n\|^2/n \xrightarrow{P} 0$ .

Now we want to show that

$$(4.30) \quad \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{v}'_t \xrightarrow{P} \mathbf{0}.$$

From (4.12) we have

$$(4.31) \quad \begin{aligned} \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{v}'_t &= \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \mathbf{v}_{t-s-1} \mathbf{v}'_t \\ &+ \frac{1}{n} \sum_{t=1}^n \mathbf{B}^{t-1} \mathbf{x}_0 \mathbf{v}'_t + \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{t-s-1} \mathbf{v}'_t. \end{aligned}$$

It was shown in Section 3 that the first two terms on the right-hand side of (4.31) converge to  $\mathbf{0}$  in probability as  $n \rightarrow \infty$ .

Define  $\mathbf{v}_{nt}$  by (3.10) and  $\mathbf{z}_{nt}$  by

$$(4.32) \quad \mathbf{z}_{nt} = \mathbf{z}_t I(\|\mathbf{z}_t\|^2 \leq n).$$

Then

$$(4.33) \quad \Pr \left\{ \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{t-s-1} \mathbf{v}'_t = \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{n,t-s-1} \mathbf{v}_{nt}' \right\} \rightarrow 1.$$

Consider

$$(4.34) \quad \begin{aligned} &\mathcal{E} \operatorname{tr} \left( \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{n,t-s-1} \mathbf{v}_{nt}' \right)' \left( \frac{1}{n} \sum_{t=1}^n \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{n,t-s-1} \mathbf{v}_{nt}' \right) \\ &= \frac{1}{n^2} \mathcal{E} \left[ \sum_{t=1}^n \left( \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{n,t-s-1} \right)' \left( \sum_{r=0}^{t-2} \mathbf{B}^r \Delta \mathbf{z}_{n,t-r-1} \right) \mathcal{E}(\mathbf{v}_{nt}' \mathbf{v}_{nt} | \mathcal{F}_{t-1}) \right] \\ &= \frac{1}{n^2} \mathcal{E} \sum_{t=1}^n \left\| \sum_{s=0}^{t-2} \mathbf{B}^s \Delta \mathbf{z}_{n,t-s-1} \right\|^2 \mathcal{E}(\mathbf{v}_{nt}' \mathbf{v}_{nt} | \mathcal{F}_{t-1}) \\ &\leq \frac{1}{n} \mathcal{E} \max_{s=1, \dots, n} \|\mathbf{z}_{ns}\|^2 \sum_{s=0}^{n-1} \operatorname{tr} \Delta' (\mathbf{B}')^s \mathbf{B}^s \Delta \mathcal{E}(\mathbf{v}_{nt}' \mathbf{v}_{nt} | \mathcal{F}_{t-1}) \\ &\rightarrow 0 \end{aligned}$$

because  $\|\mathbf{z}_{ns}\|^2/n \xrightarrow{P} 0$  and  $\|\mathbf{z}_{ns}\|^2$  is bounded and  $\Sigma_t \xrightarrow{P} \Sigma$  and  $\|\mathbf{v}_{nt}\|^2$  is bounded.

This proves (4.20) and the theorem. ■

**Lemma 6.** If assumptions of Theorem 7 hold and if  $\Sigma$  and  $M_0$  are positive definite, then (4.24) is positive definite.

**Proof.**

$$\begin{aligned}
 (4.35) \quad (c', d') \begin{pmatrix} Q & L \\ L' & M_0 \end{pmatrix} \begin{pmatrix} c \\ d \end{pmatrix} &= \text{plim}_{n \rightarrow \infty} \frac{1}{n} \sum_{t=1}^n (c' x_{t-1} + d' z_t)^2 \\
 &= \text{plim}_{n \rightarrow \infty} \frac{1}{n} \sum_{t=1}^n \left[ (c' v_{t-1})^2 + (c' B x_{t-1} + c' \Delta z_{t-1} + d' z_t)^2 \right. \\
 &\quad \left. + 2c' v_{t-1} (x'_{t-2} B' c + z'_{t-1} \Delta' c + z'_t d) \right] \\
 &= c' \Sigma c + \text{plim}_{n \rightarrow \infty} \frac{1}{n} \sum_{t=1}^n (c' B x_{t-1} + c' \Delta z_{t-1} + d' z_t)^2 \\
 &\geq c' \Sigma c
 \end{aligned}$$

by (4.3) and (4.30). If the left-hand side of (4.35) is 0, then  $c = 0$  because  $\Sigma$  is positive definite. In that case the left-hand side of (4.35) is  $d' M_0 d = 0$ ; since  $M_0$  is positive definite,  $d = 0$ . ■

A special case of the mixed model is  $z_t = 1$ . Then (4.1) is

$$(4.36) \quad x_t = B x_{t-1} + \gamma + v_t,$$

where  $\gamma = \Delta$  or

$$(4.37) \quad x_t - \mu = B(x_{t-1} - \mu) + v_t,$$

where  $\gamma = (I - B)\mu$ . In this case (2.41), (4.4) and (4.5) are automatically satisfied, and condition (4.10) reduces to

$$(4.38) \quad \frac{1}{n} \sum_{t=1}^n (\Sigma_t \otimes v_{t-1-s}) \xrightarrow{p} 0, \quad s = 0, 1, \dots$$

The matrix  $L$  is

$$(4.39) \quad L = \sum_{s=0}^{\infty} B^s \gamma = (I - B)^{-1} \gamma,$$

and the matrix  $Q$  is

$$(4.40) \quad Q = \Gamma + (I - B)^{-1} \gamma \gamma' (I - B')^{-1}.$$

In this case

$$(4.41) \quad \hat{B}_n = \left( \sum_{t=1}^n \mathbf{x}_t \mathbf{x}'_{t-1} - \frac{1}{n} \sum_{t=1}^n \mathbf{x}_t \sum_{t=1}^n \mathbf{x}'_{t-1} \right) \left( \sum_{t=1}^n \mathbf{x}_{t-1} \mathbf{x}'_{t-1} - \frac{1}{n} \sum_{t=1}^n \mathbf{x}_{t-1} \sum_{t=1}^n \mathbf{x}'_{t-1} \right)^{-1}$$

and  $\hat{\mu}_n = (I - \hat{B}_n) \hat{\gamma}_n$ , which is approximately  $(1/n) \sum_{t=1}^n \mathbf{x}_t$ . The limiting covariance matrix of  $\sqrt{n}[(1/n) \sum_{t=1}^n \mathbf{x}_t - \mu]$  is

$$(4.42) \quad (I - B)^{-1} \Gamma + \Gamma (I - B')^{-1} - \Gamma.$$

The condition (4.5) suggests a kind of lack of correlation between  $\mathbf{z}_{t+h}$  and  $\mathbf{v}_t$  which is plausible if  $\{\mathbf{z}_t\}$  and  $\{\mathbf{v}_t\}$  are independent; that is, if the  $\mathbf{z}_t$ 's are exogenous.

## Appendix

**Lemma 7.** Let the largest absolute value of the characteristic roots of  $B$  of order  $p$  be  $\lambda < 1$ . Then for any vectors  $u$  and  $v$

$$(A.1) \quad |u'(B')^r B^s v| \leq \lambda^{r+s} q r^{p-1} s^{p-1} (\|u\|^2 + \|v\|^2)$$

for a suitable constant  $q$ .

**Proof.** There exists a matrix  $P$  such that  $B = P^{-1} H P$ , where

$$(A.2) \quad H = \begin{bmatrix} H_1 & 0 & \cdots & 0 \\ 0 & H_2 & \cdots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \cdots & H_K \end{bmatrix}.$$

the  $p_k \times p_k$  matrix  $H_k = \lambda_k I + L_k$ ,  $\lambda_k$  is a characteristic root of  $B$ , and

$$(A.3) \quad L_k = \begin{pmatrix} 0 & 0 & 0 & \cdots & 0 & 0 \\ 1 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 1 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 1 & 0 \end{pmatrix}.$$

Then

$$(A.4) \quad u'(B')^r B^s v = u' P' (H')^r (P P')^{-1} H^s P v.$$

Let

$$(A.5) \quad (P P')^{-1} = G = \begin{bmatrix} G_{11} & G_{12} & \cdots & G_{1K} \\ G_{21} & G_{22} & \cdots & G_{2K} \\ \vdots & \vdots & & \vdots \\ G_{K1} & G_{K2} & \cdots & G_{KK} \end{bmatrix}.$$

For  $s \geq p_k - 1$  we have

$$(A.6) \quad \begin{aligned} H_k^s &= \lambda_k^s I + \lambda_k^{s-1} \binom{s}{1} L_k + \cdots + \lambda_k^{s-(p_k-1)} \binom{s}{p_k-1} L_k^{p_k-1} \\ &= \lambda_k^s \left[ I + \lambda_k^{-1} \binom{s}{1} L_k + \cdots + \lambda_k^{-(p_k-1)} \binom{s}{p_k-1} L_k^{p_k-1} \right], \end{aligned}$$

$$\begin{aligned}
(A.7) \quad (H'_k)^r G_{k\ell} H_\ell^s &= \lambda_k^r \lambda_\ell^s \left[ G_{k\ell} + \lambda_k^{-1} \binom{r}{1} L'_k G_{k\ell} + \lambda_\ell^{-1} \binom{s}{1} G_{k\ell} L_\ell + \dots \right. \\
&\quad \left. + \lambda_k^{-r} \lambda_\ell^{-s} \binom{r}{p_{k-1}} \binom{s}{p_{\ell-1}} (L'_k)^{p_k-1} G_{k\ell} L_\ell^{p_\ell-1} \right] \\
&= \lambda_k^r \lambda_\ell^s Q_{k\ell}(r, s).
\end{aligned}$$

Let  $Pu = x$ ,  $Pv = y$  and

$$\begin{aligned}
(A.8) \quad Q(r, s) &= \begin{bmatrix} Q_{11}(r, s) & Q_{12}(r, s) & \cdots & Q_{1K}(r, s) \\ Q_{21}(r, s) & Q_{22}(r, s) & \cdots & Q_{2K}(r, s) \\ \vdots & \vdots & \ddots & \vdots \\ Q_{K1}(r, s) & Q_{K2}(r, s) & \cdots & Q_{KK}(r, s) \end{bmatrix} \\
&= (q_{ij}(r, s)).
\end{aligned}$$

The element  $q_{ij}(r, s)$  is a polynomial in  $r$  and  $s$  of degree at most  $p-1$  with fixed coefficients.

Then

$$\begin{aligned}
(A.9) \quad |x' \lambda^{r+s} Q(r, s) y| &\leq \lambda^{r+s} \sum_{i,j=1}^p |q_{ij}(r, s)| |x_i| |y_j| \\
&\leq \lambda^{r+s} \sum_{i,j=1}^p \frac{|q_{ij}(r, s)|}{2} (x_i^2 + y_j^2) \\
&\leq p \lambda^{r+s} \max_{i,j=1,\dots,p} \frac{|q_{ij}(r, s)|}{2} (\|x\|^2 + \|y\|^2).
\end{aligned}$$

Let

$$(A.10) \quad q_{ij}(r, s) = \sum_{g,h=0}^{p-1} q_{ij}^{gh} r^g s^h.$$

Then

$$(A.11) \quad \max_{i,j=1,\dots,p} |q_{ij}(r, s)| \leq \max_{i,j=1,\dots,p} \sum_{g,h=0}^{p-1} |q_{ij}^{gh}| r^{p-1} s^{p-1}$$

and  $\|x\|^2 \leq \|u\|^2$  times the maximum characteristic root of  $PP'$  and similarly for  $\|y\|^2$ .

The lemma follows. ■

**Lemma 8.** (3.28).

**Proof.** The left-hand side of (3.28) is positive semidefinite. Its trace is

$$(A.12) \quad \frac{1}{n} \sum_{t=1}^n \text{tr } \Sigma_t \text{tr } \mathbf{x}'_0 (\mathbf{B}')^{t-1} \mathbf{B}^{t-1} \mathbf{x}_0 \leq \frac{1}{n} \sum_{t=1}^n \text{tr } \Sigma_t \lambda^{2t-2} t^{2p-2} q^* \|\mathbf{x}_0\|^2.$$

We can take  $t_0$  large enough so that for  $t > t_0$  and arbitrary  $\varepsilon > 0, \delta > 0$

$$(A.13) \quad \Pr\{\lambda^{2t-2} t^{2p-2} q^* \|\mathbf{x}_0\|^2 < \varepsilon\} > 1 - \delta.$$

Then the right-hand side of (A.12) is with probability greater than  $1 - \delta$  not greater than

$$(A.14) \quad \frac{1}{n} \sum_{t=1}^{n_0} \text{tr } \Sigma_t \lambda^{2t-2} t^{2p-2} q^* \|\mathbf{x}_0\|^2 + \varepsilon \frac{1}{n} \sum_{t=n_0}^n \text{tr } \Sigma_t \xrightarrow{P} \varepsilon \text{tr } \Sigma$$

as  $n \rightarrow \infty$ . ■

### Comments on Condition (2.5)

A key assumption is

$$(A.15) \quad \sup_{t=1,2,\dots} \mathcal{E}[v'_t v_t I(v'_t v_t > a) | \mathcal{F}_{t-1}] \xrightarrow{P} 0$$

as  $a \rightarrow \infty$ ; that is, given  $\varepsilon > 0, \delta > 0$  there exists  $a_0$  such that for  $a > a_0$

$$(A.16) \quad \Pr \left\{ \sup_{t=1,2,\dots} \mathcal{E}[v'_t v_t I(v'_t v_t > a) | \mathcal{F}_{t-1}] \leq \varepsilon \right\} \geq 1 - \delta.$$

Let  $W_t(a) = \mathcal{E}[v'_t v_t I(v'_t v_t > a) | \mathcal{F}_{t-1}]$ . The above event for fixed  $a$  is

$$(A.17) \quad \bigcap_{t=1}^{\infty} \{W_t(a) \leq \varepsilon\},$$

which is measurable. The random variable

$$(A.18) \quad X_n(a) = \max_{t=1,\dots,n} W_t(a)$$

has the property

$$(A.19) \quad X_{n+1}(a) = \max [X_n(a), W_{n+1}(a)].$$

Note that for given  $a$   $X_n(a)$  is nondecreasing in  $n$ . The event (A.17) is

$$(A.20) \quad \left\{ \lim_{n \rightarrow \infty} X_n(a) \leq \varepsilon \right\} = \bigcap_{n=1}^{\infty} \{X_n(a) \leq \varepsilon\}.$$

Note that since  $X_n(a)$  can be defined by (A.19), it is a one-dimensional variable; that is, the condition is a weak condition, not a strong condition. It is a condition on the cdf's of  $X_n(a)$ .
